

**West Fraser**

**Sustainability Report**

**March 2009**

## **A MESSAGE FROM OUR CHAIR, PRESIDENT AND CHIEF EXECUTIVE OFFICER**

### **Operating Sustainably Means More Than Just Planting Trees**

At West Fraser, we are proud of our reforestation record. We have planted over 1.1 billion trees since the Company was founded in 1955, including 55 million in 2008 alone. However, operating in a sustainable manner means more than just planting trees. We see our commitment to sustainability as a promise to utilize our resources responsibly and to take meaningful and

ongoing steps to reduce our impact on the environment. This means reducing greenhouse gas emissions and chemical and material consumption, recycling chemicals, oil products and other materials, protecting wildlife and other forest values, and improving our reforestation programs and the quality of air and water discharged from our manufacturing plants.

In addition to our environmental responsibilities, we have significant social responsibilities. We are an integral part of the towns and regions in which we operate and we strive to provide economic stability to the employees, families and communities that depend on us. We also contribute significant funding and other resources towards enhancing the social well-being of our communities. We support initiatives related to sports and recreation, education, health care, the arts and more.

In this Sustainability Report, we will share information about our environmental performance and social contributions. As a company, we are committed to continual improvement in everything we do, and that includes our reporting efforts on sustainability and other important issues. I hope you find this report useful in understanding the many ways in which our company is working to lessen our environmental impact, while helping to improve the lifestyles of our employees and the prosperity of the communities in which we operate. We welcome your comments and questions. Please contact us at [trees@westfraser.com](mailto:trees@westfraser.com) should you require any additional information about our sustainability practices and performance.

**Hank Ketcham**

## West Fraser Environmental Policy

West Fraser Timber Co. Ltd. is committed to responsible stewardship of the environment. A philosophy of continual improvement of our forest practices and manufacturing procedures has been adopted to optimize the use of resources and minimize or eliminate the impact of our operations on the environment.

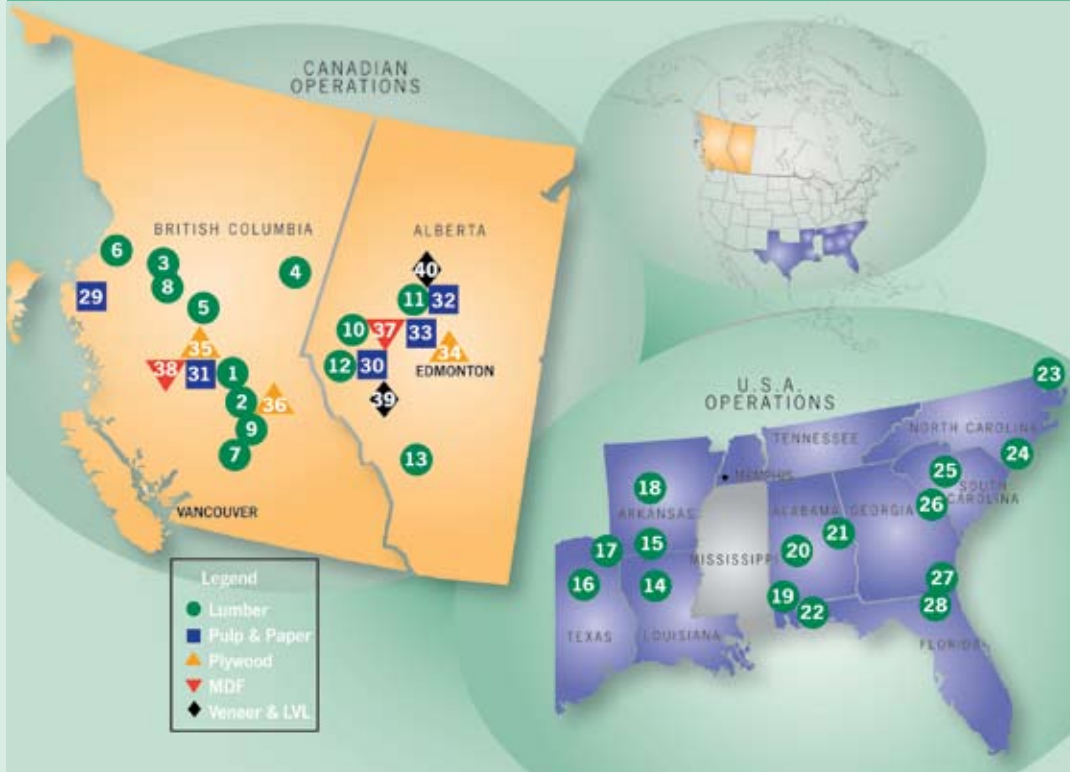

West Fraser recognizes that environmental excellence is an integral aspect of long-term business success. Our Company and its employees are committed to the following:

- Complying with all applicable environmental laws and regulations, and with other requirements to which the organization subscribes.
- Preventing pollution and continuing to improve our environmental performance by setting and reviewing environmental objectives and targets.
- Conducting periodic environmental audits.
- Providing training for employees and contractors to ensure environmentally responsible work practices.
- Communicating our environmental performance to employees, customers, shareholders, local communities and other stakeholders.
- Reviewing, on a regular basis, this policy to ensure that it reflects the Company's ongoing commitment to environmental stewardship.

## ABOUT WEST FRASER

West Fraser is a North American wood products company that was founded in 1955. The Company produces lumber, panel products, pulp, linerboard, kraft paper, newsprint and wood chips. Today, West Fraser employs approximately 8,500 people and operates manufacturing facilities in two western Canadian provinces and eight southern U.S. states. Sales and administrative offices are located in Vancouver and Quesnel, B.C. and Memphis, Tennessee.

## FOREST MANAGEMENT AND PROTECTION

West Fraser manages approximately 8.5 million hectares (21 million acres) of Crown forestland in western Canada. This translates into 85,000 square kilometers (33,000 square miles) or an area that is slightly larger than Austria. In the U.S., West Fraser does not own or manage any forestland. All of the fibre for our U.S. mills is secured from third party sources.

**West Fraser manages over 8.5 million hectares of Crown forestland in British Columbia and Alberta.**

The fibre for West Fraser's Canadian operations is primarily derived from provincially-owned forestland that we manage in British Columbia and Alberta. Timber harvesting operations are regulated by government under various license agreements. All actions related to harvesting and reforestation must be approved by government. To obtain these approvals, our forestry staff must prepare detailed long-range plans that illustrate how the trees will be harvested, how we will protect wildlife, biodiversity and value for other stakeholders, and how and when harvested areas will be reforested. These plans are prepared with community consultation.

Our forestry professionals examine everything from wildlife migration patterns to fire risk and insect infestations. In addition to looking after the values of the forest, they also look at other uses of the land base and ensure the forestlands we manage are available to multiple stakeholders for recreation, education and employment.

### Reforestation for the Future

West Fraser planted over 55 million trees in 2008. Since the Company was founded in 1955, our operations have planted over 1.1 billion trees. All harvested areas are reforested following harvest completion. This is accomplished by planting native species and managing natural regeneration to re-establish the historic natural forest landscape. This continuous cycle of regeneration, growth and replacement perpetuates the natural historic diversity of the native forests in a manner that mimics the cycles inherent in nature over past centuries.

**West Fraser operations have planted over 1.1 billion trees.**

### **Making History**

**In 1994, West Fraser made history with a decision to permanently relinquish harvesting rights to the Kitlope Valley in northwestern B.C. This decision resulted in the Company returning 317,000 hectares or 3,175 square kilometers (1,125 square miles) of land to the provincial government, without compensation, to allow for the creation of a new protected area called the Kitlope Heritage Conservancy.**

**The Kitlope is the largest intact coastal temperate rainforest on earth and West Fraser's action was the largest voluntary relinquishment of harvesting rights in North American history. This decision will allow future generations to enjoy a wilderness area seven times the size of America's Redwood National Park and more than one-half the size of Germany's entire Black Forest region.**

### **Mountain Pine Beetle**

One of the most significant issues facing the wood products industry in British Columbia and now Alberta is the mountain pine beetle (MPB). This small insect that measures less than 1 centimetre (1/2 inch) in length has spread throughout the central interior region of B.C. over the past two decades and has recently been found on the eastern slopes of the Rocky Mountains in Alberta.

Along with the provincial and federal governments, West Fraser is aggressively addressing the MPB infestation in B.C. and Alberta. Almost all of the wood processed by West Fraser in B.C. at the present time is derived from MPB-damaged stands. The Company's objective is to control the spread of MPB, particularly as it spreads into Alberta, and to salvage trees killed by MPB for as long as possible.

Although the logs affected by MPB are dry, they can have a shelf life of many years and can be processed into lumber and other products. Our woodlands staff have made modifications to our harvest plans so that MPB-affected timber can be harvested before healthy timber, maximizing value from the affected timber and slowing the spread of MPB to nearby green (unaffected) forest stands. In addition, by harvesting the affected timber, we can re-plant these areas with healthy young trees that are more resistant to MPB.

## West Fraser is Committed to Protecting Wildlife

At West Fraser, protecting wildlife and preserving wildlife habitat are key components of our forest management planning process. Our woodlands staff, which includes professional foresters and biologists, monitors and protects wildlife in our operating areas and actively works with government and other stakeholders to maintain healthy wildlife populations.

**In 2007, West Fraser made two major harvesting deferrals to support government-led caribou recovery initiatives.**

### Caribou Recovery

Protecting caribou habitat is a high priority. The Company's Hinton, Alberta-based wildlife biologist studies caribou populations while assessing impacts of harvesting on caribou and researching ways to conserve caribou habitat.

In 2007, West Fraser made two major harvesting deferrals to support government-led caribou recovery initiatives. The Company deferred harvesting on 50,000 hectares (123,500 acres) of the Hinton Forest Management Agreement (FMA), which more than doubled a 1994 deferral for caribou habitat protection on the same FMA. The Company also announced a 100,000 hectare (247,000 acre) deferral in the Quesnel and Williams Lake areas in support of a mountain caribou recovery strategy initiated by the B.C. government.

With the deferral at Hinton, West Fraser has now voluntarily deferred harvesting in all caribou range on the Hinton FMA. This was done to allow for a full range of options to be considered in the development of a new forest management plan for the area. Two of West Fraser's other Alberta operations manage forest areas outside of the Hinton FMA and two caribou herds are located within these areas. However, we do not currently harvest in any part of these areas that are designated by the Alberta government as caribou habitat.

In B.C., two mountain caribou herds are located in West Fraser's operating areas and both are considered stable according to 2006 census data published by the B.C. government. West Fraser supports the new B.C. government Caribou Recovery Plan, which was completed in 2008.

In addition to conducting our own research into caribou habitat protection, West Fraser supports the research of other groups interested in caribou protection. This includes the Foothills Research Institute (formerly the Foothills Model Forest) in Alberta. West Fraser is a major sponsor of the Foothills Research Institute program, which takes various approaches to caribou and other wildlife protection and develops innovative and sustainable forestry practices.

### Grizzly Bear Conservation

Grizzly bears are found in most of the B.C. and Alberta forests managed by West Fraser. Young forests originating from natural disturbances like forest fires, or managed disturbances like harvesting, provide plenty of food for Grizzly bears, which are designated as a species of special concern.

West Fraser is a charter sponsor of a major Grizzly bear research study conducted by the Foothills Research Institute. Over the past nine years, location information has been collected from 119 Grizzly bears fitted with global positioning system collars. The researchers have learned that human-caused mortality is the biggest conservation issue, and West Fraser is now working with provincial governments and other organizations to reduce mortality rates. We plan roads to avoid the most active Grizzly bear habitats and deactivate or reclaim roads that are no longer needed in order to reduce potential bear-human conflicts.

### Third Party Certification Demonstrates Sustainability

All of the woodlands operations directly managed by West Fraser are certified by the Sustainable Forestry Initiative (SFI), which is an internationally-recognized sustainable forest management certification program. Certification demonstrates to our customers that the products they purchase are derived from sustainably-managed forests. Independent auditors verify that standards are met for a number of key criteria, including biodiversity, habitat protection, reforestation and harvest levels.

In addition to meeting the rigorous requirements of SFI, all of the woodlands operations we directly manage have been certified to the International Organization for Standardization (ISO) 14001 Environmental Management System standard.

SFI is endorsed by the Programme for the Endorsement of Forest Certification (PEFC), which is a global organization that provides a mutual recognition framework for national certification systems. PEFC recognizes more than 25 national certification systems and assures customers that differing systems provide a consistent level of sustainable forest management according to PEFC criteria. Chain of custody verification is also important to our customers and all West Fraser's Canadian manufacturing operations adhere to the PEFC Chain of Custody system. Chain of custody allows customers to track the fibre from its origin to its final destination and demonstrates that the fibre meets all criteria of the respective certification system.

#### Advantages of Sustainable Forestry Initiative Certification

There are many advantages to Sustainable Forestry Initiative (SFI) certification, including:

- **Independent Governance** – SFI is a fully independent, registered non-profit organization with a governance structure. SFI places equal importance on three key areas related to sustainable forest management – social, economic and environmental.
- **International Acceptance** – SFI is endorsed by the Programme for Endorsement of Forest Certification (PEFC), a globally recognized organization with strict requirements. SFI is also recognized by many governments, including the United States, the United Kingdom and Japan.
- **Legality** – All SFI certified wood must come from well-managed forests and cannot include any wood that has been sourced illegally.
- **Protection of Special Sites** – SFI member companies must manage lands of special significance – biological, geological, historical, or culturally important.

## MANUFACTURING

### Investing in Our Future

At West Fraser, we have made substantial investments at our solid wood, panel, and pulp and paper manufacturing facilities to reduce the amount of energy we consume and the amount of greenhouse gas (GHG) emissions we generate. We also strive to maximize the utilization of by-products and minimize waste. At many of our operations we have invested in new technology that allows us to extract the most value from every log. This has resulted in a high recovery or yield from our raw materials. By increasing our recycling and using more of our by-products and waste, we have reduced our need for landfill disposal.

West Fraser has invested in the latest technology, allowing us to extract the most value from every log.

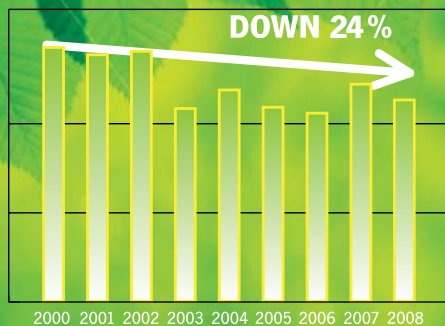

### ABOUT WEST FRASER'S LUMBER AND PANEL OPERATIONS

West Fraser is one of the largest lumber manufacturers in the world, producing lumber and wood by-products at 30 sawmills in western Canada and the southern United States. In total, West Fraser has an annual production capacity of approximately 6 billion board feet of spruce-pine-fir (SFP) and southern yellow pine (SYP) lumber. This is enough lumber to build more than 450,000 average sized homes (2,000 square ft. each).

West Fraser's panel operations include three plywood mills that primarily produce standard softwood sheathing plywood, two medium density fibreboard (MDF) mills, each with the flexibility to manufacture varying thicknesses and sizes, and a laminated veneer lumber (LVL) mill. The annual production capacities for these products are 820 million square feet (3/8" basis) of plywood, 300 million square feet (3/4" basis) of MDF and 3.2 million cubic feet of LVL.

### GHG EMISSIONS

Direct GHG emissions at our Canadian operations are down by approximately 24% since 2000.

natural gas previously used to dry lumber and to create steam used in the pulp manufacturing process. GHGs are primarily produced by burning fossil fuels, such as natural gas.

### Reducing Energy and GHG Emissions at Our Lumber and Panel Operations in Canada

The energy systems installed at many of West Fraser's Canadian lumber and panel operations have allowed these mills to significantly reduce natural gas consumption by converting wood waste to energy. In the past, wood waste from a number of the sawmills that are now equipped with energy systems was sent to incineration burners. Some West Fraser operations

### Alternative Energy Generation and Reduction of Greenhouse Gas Emissions

The facilities we now own in Canada have reduced annual GHG emissions by more than 180,000 tonnes or 24% since 2000. This decline in emissions reflects the use of wood waste such as sawdust, bark and other residual by-products to produce energy, displacing

that don't have an energy system have hogfuel processing equipment that prepares wood waste material for use in the energy systems at other operations. This has allowed for the permanent decommissioning of incineration burners in several of our communities.

In conjunction with energy systems, additional projects related to energy efficiency, such as the installation of new dryer technology in our plywood mills and improvements in our kiln drying processes, have helped our operations realize downward trends in the amount of energy consumed and GHGs generated per unit of product produced.

**Lumber Operations in the U.S.**

West Fraser acquired 13 sawmills in the southern United States in 2007. These mills, and two mills in the U.S. south already owned by West Fraser, began tracking GHG emissions in 2007. The GHG emissions from fossil fuels at our U.S. operations for 2008 totaled 70,000 tonnes. This low level of GHG emissions is the result of a long-term practice of utilizing waste wood instead of fossil fuels in boilers to make steam for the lumber drying process. Fine tuning of these energy systems and improvements in kiln efficiencies have further

reduced GHGs.

**Reducing GHG Emissions and Energy Consumption at Pulp and Paper Operations**

A continuous focus on reducing energy consumption and the use of fossil fuels at all of West Fraser's pulp and paper operations has resulted in an overall reduction in GHGs at these plants of more than 15% from 2000 to 2008. Burning fossil fuels is one of the largest contributors to GHG emissions, so our pulp and paper operations have initiated projects aimed at replacing fuels such as natural gas with energy created by burning wood waste in efficient energy systems and utilizing power produced by on-site generators.

Electricity is generated at three of our pulp and paper mills.

**ABOUT WEST FRASER'S PULP, KRAFT PAPER, LINERBOARD AND NEWSPRINT OPERATIONS**

West Fraser has six operations in British Columbia and Alberta that produce pulp, linerboard, kraft paper and newsprint. All of these operations have taken measures aimed at sustainability, including energy reduction, GHG reduction, and improved effluent and air quality.

The Company produces Bleached Chemical Thermo-Mechanical Pulp (BCTMP) at its Quesnel River Pulp mill, primarily from residual softwood chips, and BCTMP at its Slave Lake pulp mill, primarily from hardwood aspen. These pulps are used by paper manufacturers to produce printing and writing papers, paperboard products and a variety of other paper grades. The mechanical pulps produced at these two mills are high yield pulps that require approximately half of the wood required by the traditional kraft pulping process.

Northern Bleached Softwood Kraft (NBSK) is produced at the Hinton and Cariboo pulp mills and is used by paper manufacturers to produce a variety of paper products, including printing and writing papers and tissues. Cariboo Pulp is a joint venture that is 50% owned by West Fraser.

At the Eurocan mill in Kitimat, B.C., the Company produces unbleached linerboard and kraft paper. Linerboard is used by producers of corrugated shipping containers while kraft paper is used in producing multi-wall industrial sacks and in various specialty products.

West Fraser also owns 50% of Alberta Newsprint Company in Whitecourt, Alberta, which produces newsprint.

In total, West Fraser's production capacity is 580,000 tonnes of BCTMP, 510,000 tonnes of NBSK, 470,000 tonnes of linerboard and kraft paper and 135,000 tonnes of newsprint.

**PULP & PAPER GHG EMISSIONS**

**Other Climate Change Initiatives**

West Fraser has taken additional measures to help track, report and reduce energy consumption and GHG emissions, including participation in numerous industry, government and special interest group projects related to these initiatives.

GHG emissions at our pulp and paper operations have been reduced by over 15% since 2000.

**Carbon Disclosure Project** — In 2008, West Fraser participated in the Conference Board of Canada's Carbon Disclosure Project (CDP) – Canada 280 Initiative. The CDP aims to create a dialogue between investors, purchasers and corporations with the goal of developing a rational response to climate change.

**FPAC Carbon Neutrality Project** – As a member of the Forest Products Association of Canada (FPAC), we participate in the FPAC Carbon Neutrality Project. In 2007, FPAC announced jointly with World Wildlife Fund (WWF) Canada, a collective industry goal to achieve carbon neutrality of the Canadian forest product value chain by 2015, without the purchase of offset credits.

#### **IT ALL ADDS UP TO BIG SAVINGS**

At many of our operations, smaller initiatives are also adding up to big savings in energy. Between 2004 and 2008, these items resulted in an average annual reduction in our electricity consumption of 24 million kilo-watt hours, which is enough electricity to power a city of 30,000 residents for one month. Some of these initiatives include:

**Correcting Inefficiencies** – Adjusting compressors and fixing leaks in compressed air systems has improved energy efficiency at a number of mills by approximately 5% annually.

**Turning Off the Lights** – We encourage our employees to turn out the lights when they go home at night and where practical, we have implemented energy-saving measures such as installing individual light switches in each office and timers on lights in areas that are used sparingly.

**Shutting Down Computers** – We encourage our employees to turn off their computers at the end of the day and if they are off between 6 pm and 8 am, that will conserve enough energy to power 36 average-sized homes for the same time period.

**Conserving Fuel** – Our employees are encouraged to conserve fuel wherever possible by shutting off the engines in Company vehicles and yard equipment to reduce periods of idling.

#### **Recycling and Waste Reduction**

At West Fraser, we recycle consumable products whenever possible, including standard items such as paper and cardboard to products such as oily rags, fluorescent light bulbs, computer equipment, batteries and anti-freeze. The paper and cardboard West Fraser recycled in 2008 exceeded 160 tonnes, which is enough recycled product to make approximately 35 million sheets of standard letter-size copy paper (8.5 inch x 11 inch).

We also recycle by-products such as residuals from our sawmills and sander dust and edge and end trim materials from our MDF plants. Utilizing this fibre for energy and ensuring we recycle other materials whenever possible, reduces the amount of waste that would otherwise be sent to landfills.

#### **Maintaining Clean Air and Water**

Maintaining clean air and water is an important consideration for West Fraser and the Company has invested considerable resources on improvements to air and water systems aimed at improving the quality of air emissions and effluent discharges at our operations.

**Lumber and Panels** – Several of our solid wood operations have moved forward in eliminating on-site burners, resulting in improved air quality for the surrounding communities. Wood waste that was being disposed of in these burners is now used primarily for energy generation.

A number of West Fraser's solid wood and panel operations are also contributing to cleaner air through the use of electrostatic precipitators (ESPs), which remove particulates prior to releasing air into the atmosphere, and allow our operations to achieve reduced particulate levels.

**Pulp and Paper** – West Fraser's pulp and paper operations have made considerable strides forward in reducing air and effluent discharges, including an overall downward trend in key effluent measurements. These include total suspended solids (TSS) and biochemical oxygen demand (BOD), two areas where we have consistently achieved results that are significantly better than our government issued permit levels.

## TSS and BOD Levels at Pulp and Paper Operations

### Total Suspended Solids (TSS)

**Eurocan Pulp & Paper**  
(milligrams per litre)

**Cariboo Pulp & Paper**  
(kilograms per day)

**Hinton Pulp & Paper**  
(kilograms per day)

**Alberta Newsprint**  
(kilograms per day)

**Slave Lake Pulp**  
(kilograms per day)

**Quesnel River Pulp**  
(milligrams per litre)

### Biochemical Oxygen Demand (BOD)

**Eurocan Pulp & Paper**  
(milligrams per litre)

**Cariboo Pulp & Paper**  
(kilograms per day)

**Hinton Pulp & Paper**  
(kilograms per day)

**Alberta Newsprint**  
(kilograms per day)

**Slave Lake Pulp**  
(kilograms per day)

**Quesnel River Pulp**  
(milligrams per litre)

## SOCIAL RESPONSIBILITY

With approximately 9,000 employees located in communities from Kitimat in northwestern, B.C. to Whitehouse in Florida, West Fraser plays a major role in the social and economic development of many towns and regions. Our property tax contributions alone help to support schools, parks, emergency services, health care, and other important programs. In addition, our payroll for direct employees adds up to over half a billion dollars annually.

West Fraser supports communities in many ways. Through our donations, we have provided support for scholarships, reading programs, libraries, community centres, health care initiatives, parks, skating arenas, swimming pools, baseball diamonds and more.

**The Company has been a major contributor to the West Fraser Timber Park in Quesnel.**

In Quesnel, B.C., where West Fraser employees number more than 1,400, the Company has been a major contributor to the West Fraser Timber Park. In 1993, West Fraser provided 90 acres of land and today the West Fraser Timber Park offers opportunities for athletes, families, outdoor enthusiasts and others. Since the initial land grant, West Fraser has contributed financially to the further development of the park and the Company continues to support the many activities that take place there.

In Hinton, Alberta, West Fraser was a key contributor to an interpretive boardwalk where visitors can view beavers, birds and aquatic life from a raised boardwalk that is manufactured from West Fraser wood and designed with donated time from Company staff.

West Fraser has been a strong supporter of education over the years and the Company has made significant contributions to regional and provincial colleges, universities and trade and technical schools. The Company has provided multi-year scholarship and research chair support to the University of British Columbia, the University of Alberta and the University of Northern B.C. (UNBC). In addition to this recent support for UNBC, West Fraser was a founding supporter of this university, which provides opportunities for students in B.C.'s north.

The Company was responsible for initiating the Pete Ketcham Memorial Scholarship in 1996, which is administered by the Vancouver Foundation. This fund provides scholarships to students who are pursuing post secondary education. The Company also supports numerous scholarships at the regional level throughout western Canada and the southern U.S.

When it comes to health care, West Fraser operations have contributed to numerous research causes and the Company recently made a multi-year pledge to UNBC's Northern Medical Programs Trust, which will support health care in a number of northern B.C. communities.

Our employees also take community support personally, and in many communities West Fraser employees contribute to, and actively participate in programs such as United Way campaigns, Terry Fox runs and many other regional and local charitable initiatives.

### **Looking Forward**

As West Fraser moves forward, the commitments we have made to operating sustainably will continue to benefit the communities in which we operate – both environmentally and socially. Our actions of yesterday, today and tomorrow will provide benefits to future generations, including healthy forests that can provide wood for shelter, residual fibre for paper and panel products and energy, employment opportunities, and community support to the towns and regions where our employees live and work.

## Glossary of Terms

**Annual Allowable Cut (AAC)** — The volume of timber that may be harvested annually under a specific timber tenure.

**Biochemical Oxygen Demand (BOD)** — A measurement of the oxygen consumption of organic material in pulp mill effluent, which gives an indication of its effect on the waters the effluent is discharged into.

**Forest Management Agreement (FMA)** — An FMA is granted by the Alberta government and entitles the holder to establish, grow and harvest timber on specified lands.

**Greenhouse Gases (GHG)** — A gas that absorbs and re-emits infrared radiation, warming the lower atmosphere.

**Hogfuel** — Bark and wood debris.

**Incineration Burner** — A wood waste incinerator, sometimes referred to as a beehive burner.

**Laminated Veneer Lumber (LVL)** — Large sheets of veneer bonded together with resin, then cut to lumber-equivalent sizes.

**Medium Density Fibreboard (MDF)** — A composite product made from wood fibre.

**Tonne** — A unit of weight in the metric system equal to one thousand kilograms or approximately 2,204 pounds. Mtonne means one thousand tonnes.

**Total Suspended Solids (TSS)** — The total of all settleable and non-settleable solids in a sample of wastewater, measured in milligrams per litre by weight.

**Wood Residuals** — Wood by-products generated in sawmills that cannot be used for pulp, including sawdust and fine wood.
