

# Overhead Crane Safety

Supervisor  
Crew  
Talk

- 1** Always complete the Pre-Use Inspection form in the crane log book and review earlier entries for any previous concerns.
- 2** Do a pre-lift site survey, to identify areas where traffic may enter the lift zone, then plan for controls if any areas of concern are found.
- 3** Identify the one person responsible for hand signals and confirm what signals are to be used.
- 4** Determine the weight of the object to be lifted, and the balance point of the load.
- 5** Inspect all slings and hardware to be used for condition and capacity.

*"Safety is a core value and business priority"*
