Talk

Equipment is energized when it:

## ***1. Is connected to an energy source***

An energy source supplies electrical, mechanical, hydraulic, pneumatic, chemical, thermal, or other energy.

## ***2. Contains residual or stored energy***

There are many types of residual energy (also called potential energy). Some common ones are: gravitational, magnetic, electrical, chemical, and elastic potential energy.

Live work is considered a last resort when performing work on energized equipment, and requires training and a permit. If possible, energized equipment should be locked out before work is done.
