

# Resecure After Two Pulls

Most injuries from pike poles occur when the pole slips out of the wood. Even if your pike pole is sharp and in good condition, the wood fiber can tear after 2 hard pulls.

*Secure the wood, do one test pull, then one actual pull. After the two pulls, resecure the pike pole.*

*If an object doesn't move with one of your hardest pulls, it won't move with 2 or 3 of your hardest pulls either.*

*"Safety is a core value and business priority"*
